

# NIST: Expose your Cyber Security weaknesses, understand your risks and see the path forward.

Our NIST assessment is a comprehensive review of your security infrastructure led by experienced cybersecurity experts, helping you to determine what technologies & security controls are operating effectively.

We don't view cyber security as just a technical issue, our methodology revolves around three key elements of information security:

people, process and technology.

The assessment is delivered in **3 key** stages and completed within 6 to 9 days.

## 1. RISK ASSESSMENT

A risk assessment will baseline your organisation against the National Institute of Standards & Technology, Cybersecurity Framework (NIST), considered to be an industry best practice. The report will detail how your business aligns to NIST & benchmark it against organisations in relation to size, location & industry.

# 2. TECHNICAL REVIEW

The technical assessment drills down into the detail of the security gaps (internal & external vulnerabilities) as well as examining your layers of security solutions & how effective they are in protecting your organisation.

# 3. ASSESSMENT REPORT

A full report of your overall security status will include:

Your security strengths & weaknesses

Recommendations on how to improve your security posture

High level plan of actions & priorities

enquiries@primoconnect.co.uk

#### **PRIORITISE**

Your existing environment will be marked using a traffic light system so you can prioritise the most pressing actions first.

#### **ASSESS**

Receive a comprehensive assessment with a cyber-security expert, based on industry best practice (NIST CSF).

### **REPORT**

Quickly determine strengths as well as opportunities for improvement with an easy to understand actionable report.

## **CUSTOMER**

IDENTIFY & FIX

Identify & fix vulnerabilities that attackers can potentially exploit with non disruptive external vulnerability scans on all externally accessible systems protected by your firewalls.

## **PROTECT**

Protect hybrid
workers with evaluation of
the layers of endpoint
security, general use of
threat intelligence &
cloud-based / on-premise
protection technologies.

#### **TEST**

Protect & tighten systems & application security with vulnerability testing from the inside of the network.
